

Stock Analysis – Black Friday

Date: 15th of November 2022

“Black Friday” is the name given to the **first day after the Thanksgiving**, which is one of the most significant shopping and spending events in United States.

Every holiday season, forecasters make estimates regarding the volume of Black Friday sales, and whether or not those expectations are met or surpassed may have an impact on market confidence, which also creates volatility for the relevant stocks’ prices.

Investors can get their first hint that this holiday shopping season is going to be especially lucrative if consumers spend a lot on Black Friday and shops report strong sales. The stock prices of retailers who report higher than expected sales can demonstrate this confidence.

With the recent report of **U.S. Consumer Price Index (CPI)** showing that inflation is at **9-months low with 7.7% as of 10th of November**, investors already have high expectations from this year’s Black Friday sales.

Black Friday for 2022 will start at 25th of November.

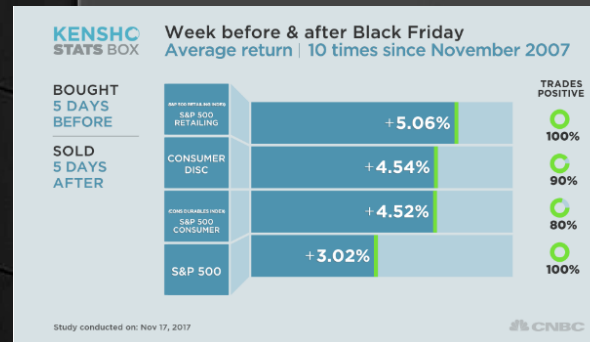

Although the term “Black Friday” is attributed to many different events in history of finance, it’s been used since 1975 to signify the “the busiest shopping and traffic day of the year” due to highly promoted sales and discounted prices by retail stores during this time of the year.

Many analysts point to the fact that Black Friday has little to no effect on the stock value on a long term trend, yet it affects the stocks on a short period, making the event especially preferable by traders looking for quicker gains.

From 2007 to 2017, a grouping of S&P 500 retail stocks posted a **5% return**, compared to the average 3% return for the S&P 500 over that period. For all 10 years, this basket of retail stocks has traded positively for the **10-day period**.

Trend continued with the S&P 500 Retailing Industry Group outperforming the S&P 500 by **1.5% and 0.1%** during that period in 2018 and 2019, respectively.

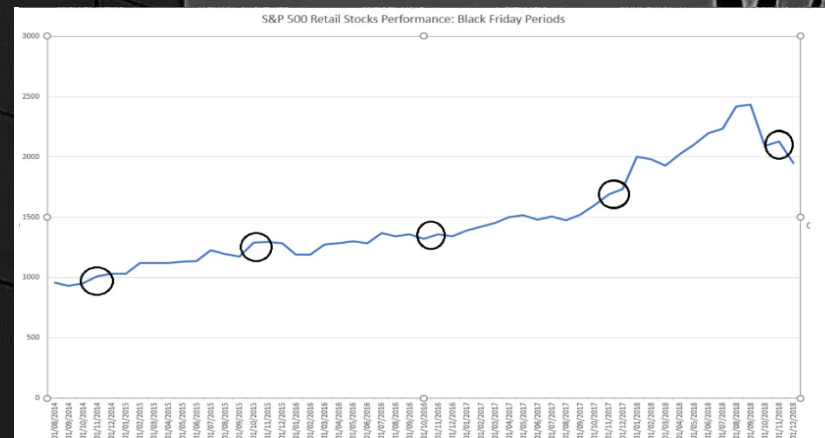

This pattern didn’t continue in 2020 due to Covid-19 pandemic, when the S&P 500 returned 4.1% but the retailing industry group only returned **2.2%**.

When it comes to stocks of e-commerce companies, investors also track the Monday after the weekend of Black Friday that is commonly referred as “**Cyber Monday**”, which marks the end of the 5-day shopping period.

Since it's the period that consumers go back to work and continue their shopping online, it's also a notable day for retail industry and a key indicator of the consumer sentiment.

A strong or weak Black Friday-through-Cyber Monday period has a big impact on retail and e-commerce stocks, but the volatility is not known to be significant enough to sway broader stock market sentiment.

Here the details for an example portfolio with the selected stocks can be reviewed

Important Note: Stock data usually shows gaps in short timeframes, mostly caused by fundamental events that cause major changes in price when markets are typically closed. Such gaps in data are generally disregarded, bearing in mind that past performance doesn't guarantee future results.

We will utilize the assets below in this example, also explaining the reasons for their selection in 4 years of data:

Amazon (AMZN) : Largest online retail and **#2 most valuable brand** ranked by Interbrand in 2021, with a market cap of \$1 trillion. Expected to be the primary driving force in this year's Black Friday.

AliBaba (BABA) : Being the Chinese equivalent of the e-commerce giant and a direct competitor in the market with \$1.6 trillion market cap, company's stock is primed for a rebound on sales recovery with its cheap stock price. It's risk in value basis is balanced with stocks of its competitors' and the financial services.

eBay Inc. (EBAY) : American multinational e-commerce company, with an impressive track record of beating Earnings estimates in each season since mid-2018.

Mastercard (MA) : One of the global leaders in online payment services and technologies with a market cap of \$326 billion, expected to prompt a revenue increase in line with retail on the Black Friday season.

Visa Inc. (V) : Another global leader in financial services with a market cap of \$427 billion, its high correlation is to be utilized in line with the expectations towards retail sales.

Portfolio : Utilizing this basket of stocks that is **strong on retail and financial services** has shown to be effective in limiting the drawdown of market overall and aims to make use of the discount on AliBaba stock as well. Portfolio is proven to be able to limit the downside volatility of Covid-19 crash of 2020.

Overall: Unsystematic risk is hedged to the point of holding **~10% in profits** as of October, also proving successful in limiting the drawdown on **BABA** at the start of Covid-19 pandemic. Expected to provide further gains in short term.

Any downward movement in the current market conditions can be dynamically hedged with **dollar index** to keep the overall drawdown of portfolio to minimum and extend the period that investors would hold their positions.

Capital Asset Pricing Model (CAPM) with 2 years of data

Utilization of Capital Asset Pricing Model (CAPM) to determine potential short-term returns shows:

Expected Returns : ~**6.52%**

Volatility (Beta) : **0.46 (<1)**

- In CAPM model, returns of a portfolio over time is compared with the **risk-free rate**, where generally **10-Year Treasury Yields** are used as the premium.
- Volatility below 1 is obtained, meaning that portfolio risk is ~54% less than the index of **S&P500**.

Value Analysis approach shows the overall financial performance of the company to give investors an idea about the growth potential for the stock.

Summary:

Amazon.com, Inc. engages in the retail sale of consumer products and subscriptions in North America and internationally. The company operates through three segments: **North America**, **International**, and **Amazon Web Services (AWS)**.
